

An aerial photograph of a tractor with a green cab and blue body working in a large, rectangular agricultural field. The field is divided into several sections by dark, parallel lines, likely from previous passes or irrigation. The tractor is positioned in the upper-left section, facing towards the bottom-left.

AUTUMN CATALOGUE

Our company

Apsov is longstanding established Italian company which constantly endeavours to enhance the field of agriculture.

Our commitment is to create new opportunities for ourselves and our customers. We constantly strive to strengthen and enhance the brand, by launching new varieties and offering excellent services.

We are genetic providers and are at the forefront in terms of innovation; we believe in a flexible and efficient organization, market oriented and strongly focused on a technical approach.

Our ambition is to be a leading company, with the best human and material resources.

The values which drive us and we seek to uphold are customer focus, passion for work, dynamism, fairness, cooperation, positivity.

apsov came into being a

Cooperative -APSOV Soc. Coop- in **1967**, when it was set up by a group of young farmers. The favourable climatic conditions of the territory, coupled with the founders' agricultural expertise have been and remain the basis for high quality seed production.

Today APSOV is still 100% owned by farmers and it is the leader of a group of companies: APSOVSEMENTI SPA (1995), Sementi Maremma (2002), GMAX seeds (2017).

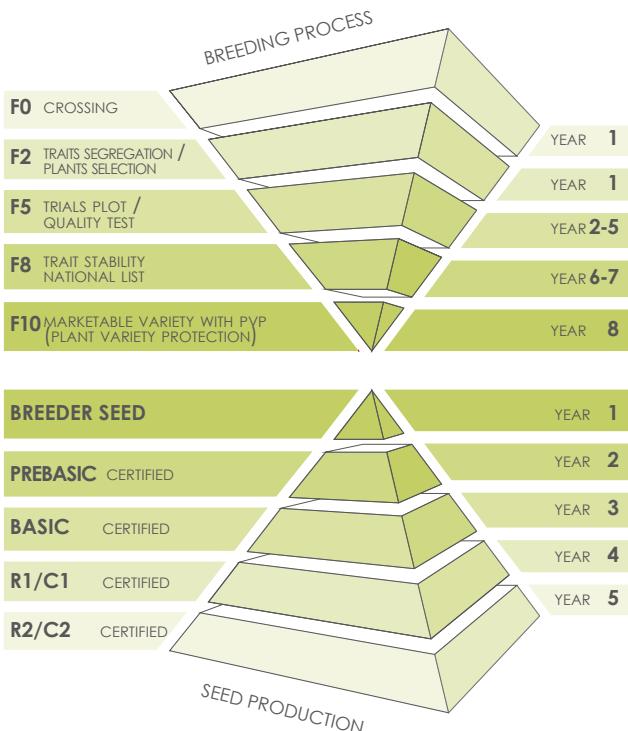

Apsov is the leading italian company in terms of production and marketing of cereals, pulses and oil crops seeds; it runs a multiplication area constantly exceeding 7.000 ha, with a seed production of about 25,000 tons / year; it generates a turnover of 22 mm, steadily increasing, which is the exclusive result of seed activity; it carries out breeding programs for bread and durum wheat, barley, triticale, employing 10 people on a full-time basis.

Breeding

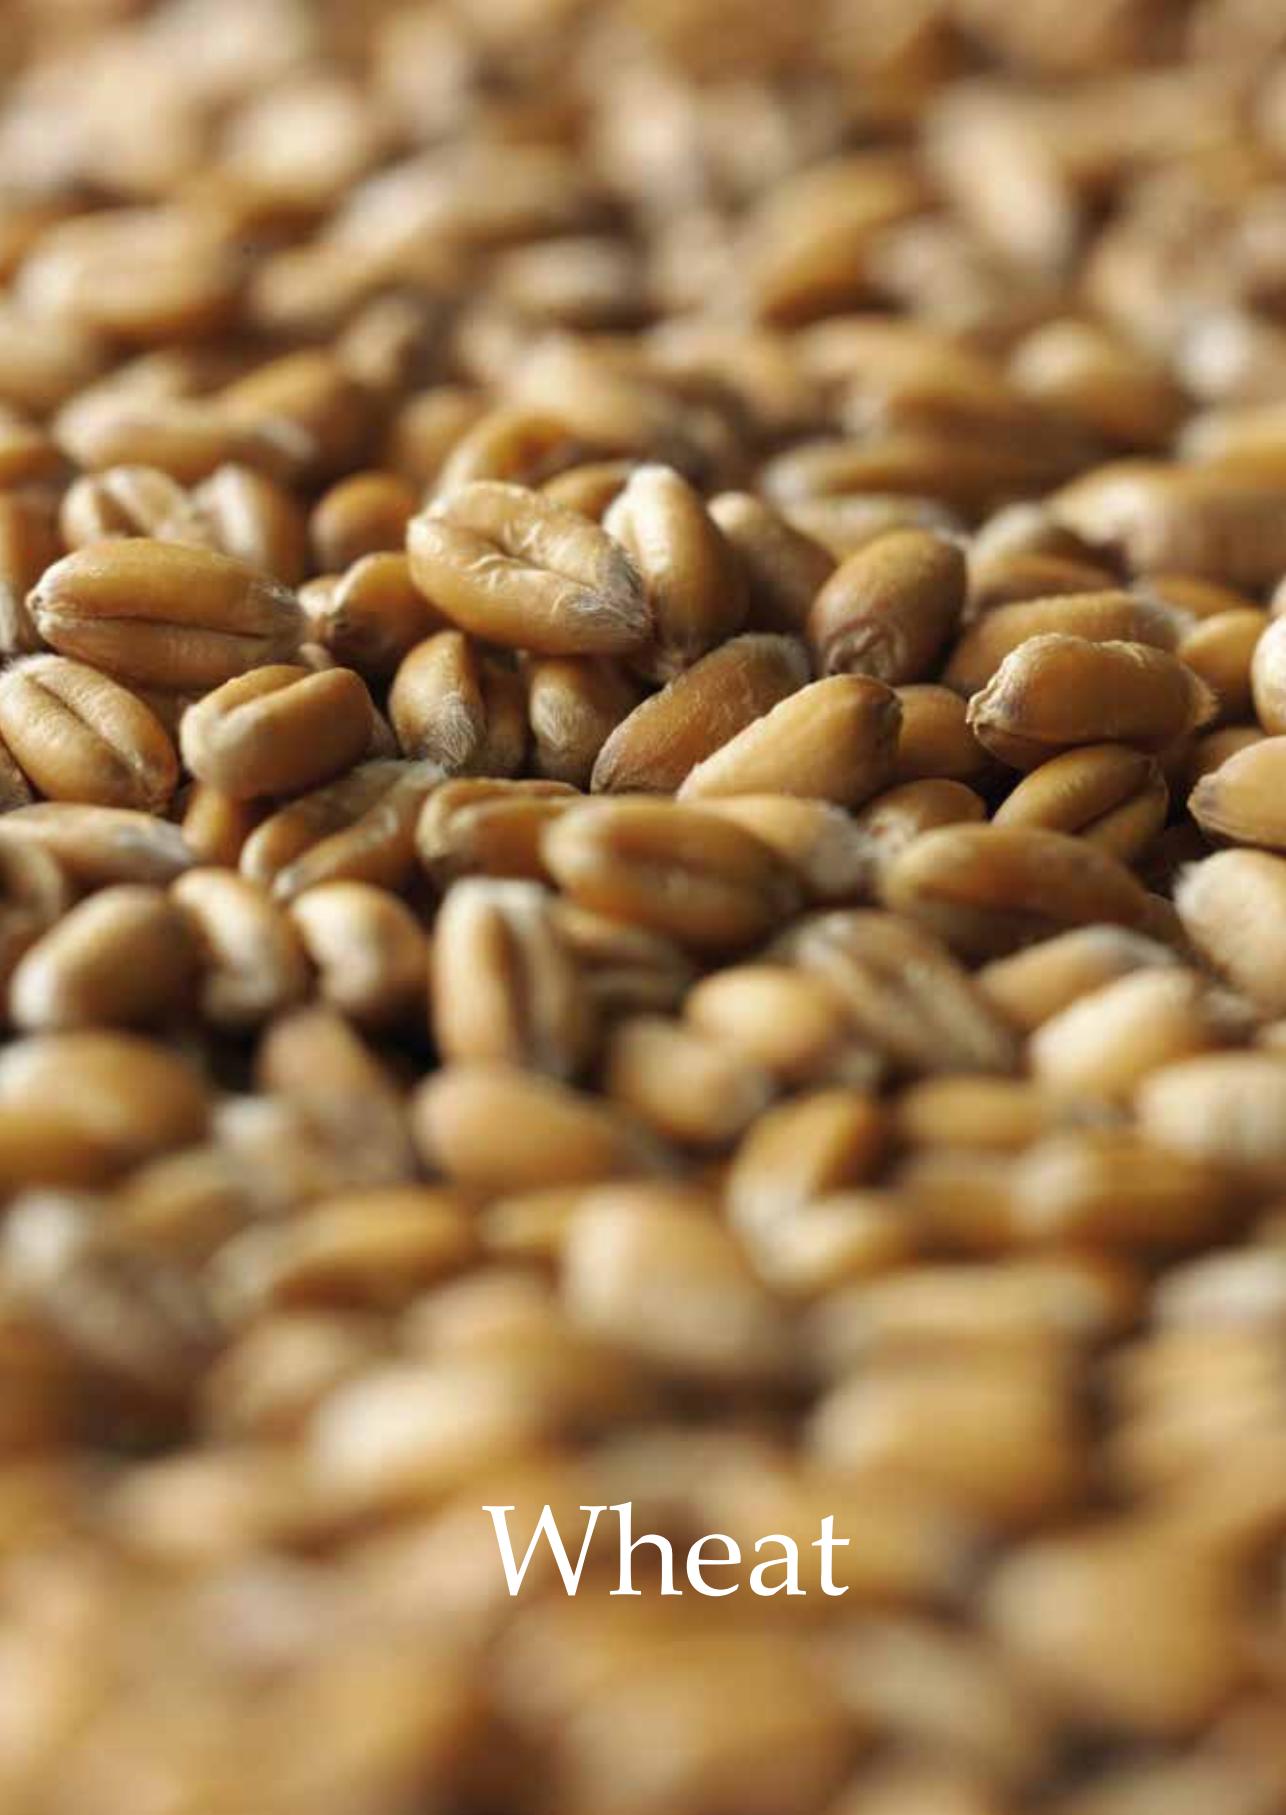

Innovation has always been apsov's strength, thanks to constant investments in research and development, acquired skills and international collaborations. Creating new varieties with high and consistent yield, suitable to match the needs of farmers, industry, and consumers is the target of our Breeding Programs.

To achieve these goals, germplasm is imported from all over the world, it is subsequently assessed and used to create segregating populations among which to select the best genotypes, through the combination of different techniques: winter nursery, single seed descent (SSD), shuttle breeding, double haploids and molecular markers.

The large trials network and the cooperation with several partners support the breeding activity and enable a timely assessment of the agronomic and quality value of the products.

A close-up, shallow depth-of-field photograph of numerous golden-brown wheat grains. The grains are oval-shaped with a textured surface, some showing small white awns at the top. They are densely packed, filling the frame.

Is our own exclusive **apsov** patent, complete and effective.

The use of varieties suitable for an early sowing and low-density seeding rate, makes this solution very efficient also from the economic point of view, with costs comparable to the traditional sowing.

The fields results are impressive. An excellent combination among performing genetics, ideal seeding rate, healthy and protected plants, offers the chance to constantly maximize yields.

Why Choose **QUALIDOSE** ?

- High yielding varieties
- Safety in early sowing
- Full comprehensive protection from fungi and insects

- Efficiency of high value treatments
- Perfect seeding ratio
- Outstanding value for the money

A close-up, shallow depth-of-field photograph of golden durum wheat grains. The grains are elongated and curved, with a distinct longitudinal groove running along their length. They are densely packed, creating a rich, textured pattern of light and shadow. The lighting highlights the natural contours and variations in the grain's surface.

Nitrogen fertilization for straw cereals

Average nitrogen requirement per Ton of grain produced

IT'S IMPORTANT TO REMEMBER THAT:

- Nitrogen input must be scheduled with the aim of supplying the plant with the right amount of this nutrient, taking into account the plant development stage, the growing environment and the yield target.
- High inputs in the early stages can lead to an hyper-vegetation, with the following possible effects: increased risk of diseases and lodging, imbalance between the vegetative and the reproductive phase.
- Later nitrogen applications - from the stem elongation phase onwards - directly impact on the accumulation of proteins in the kernels.
- Staggered nitrogen inputs are always recommended to improve the absorption efficiency of nutrients and to match the growing needs of the crop.

CHICKPEA: crop management

From December to April, later planting is possible in certain areas where spring and summer are not too hot and dry.

A minimum temperature of 9°-10°C is required for germination. To obtain 35-40 plants/m² seeding rate is 45-50 seeds/m² (130-250 kg/ha based on TKW). The distance between the rows is 45-50 cm for hoed crops and 30-35 cm with cereal planter. Tamping should be performed in order to protect the seeds from the anti-germination effect of herbicide as well as facilitating harvesting.

Chickpea is a pulse with nitrogen-fixing activity carried out by symbiotic bacteria of the genus Rhizobium. We therefore recommend a pre-planting of 60-120 units/ha or localized at sowing time 5-20 units of Phosphorus.

In order to speed up the process should conditions be harsh (significant nitrogen deficiency, strong run-off before sowing, crop precessions particularly exploiting), 20-30 units/ha of Nitrogen could be added.

Pre-emergence: - pendimethalin (ex. Stomp Aqua 1,0-1,75 lt/ha; Inca 1,5 -2,5 l/ha). - pendimethalin + aclonifen (Challenge 2,0 lt/ha).

Post-emergence: pytidate (ex. Lentagran 45 WP 1,2 – 1,8 kg/ha) for the dicotyledons control.

It is possible once 14% moisture content is reached, by using preferably axial-flow combine harvester, with beater speed setting of 350-500 rpm, large holed sieves, maximum ventilation.

Greening - cover crop

Our mixtures guarantee the highest yield, in compliance with the greening regulations.

Arezzo Efa ensures full grain production and soil covering after the harvest. Suitable for organic cropping.

Greening Pro guarantees maximum biomass production together with best silage and hay quality. Intended for the production of biogas as well as fodder for lactating dairy cows .

Cover Pro is a mixture of early species and varieties with fast green covering, suitable for any conditions. Low set-up cost.
